The machinery are industrial lifts used to raise materials and equipment. Most commonly they are used in production and manufacturing settings. The scissor lift is otherwise called a table lift. This unit is an industrial lift designed particularly for use at retail and wholesale work places. Often found in the aisles of big retail stores, the scissor lift is a platform together with wheels. It functions like a forklift. The scissor lift is an effective mode of transporting people and objects above ground level.

The scissor lift got its name from the unique design that raises its platform in the air. The platform is raised when the connected, folding supports under are drawn together, in scissor-like fashion, propelling it upward. At its tallest height, a scissor lift can extend from 6.4 to 18.8 meters in the air depending on the type. Hydraulics or an electric motor are used to propel the platform in the air, moving slower at the end and faster in the middle of the lift.

Ever since the first designs of the scissor lift was developed during the 1970s, they are still being built according to the same basic designs. Nevertheless, some of the materials used have bee made better as well as there being far better safety implements included into the designs. Newer models could travel over the smooth floor of a warehouse or the uneven ground of a construction site. The unit was meant to help productivity in the many retail establishments which were growing larger. Compared to the forklift, the scissor lift is more useful and more portable in retail environment. They are the only industrial platforms which could be retracted and placed into a relatively small storage area.
