

Fort McMurray Manlift Training

Fort McMurray Manlift Training - There are lots of manlift training courses which provide a review of the manlift equipment. The practicum part of the training is another vital portion of the course. In this section the trainee has chance to demonstrate their practical abilities, their ability to operate the manlift safely. A requirement to Manlift training is the fall protection training, that could be incorporated in the training according to the particular needs of the customer.

Course Content

The course consists of the following areas of instruction: the effect of performing unsafe acts or using unsafe equipment, pre-shift machine inspection and work area survey requirements, Review of load capacities, Lifting devise equipment definitions, the particular equipment requirements and safety decals, Review of related sections of the CSA Standards as well as the OHSA Standards and Review site specific Dangers, together with controls for safe use of a lifting device.

Demonstration and Evaluation Content

The evaluation and demonstration portion of the program includes: making use of a spotter or a signaler when needed; Proper personal protective equipment or also referred to as P.P.E. as required; using a lift only on solid and level ground; Making use of the proper fitting harness or fall arrest device; Operating the lift with all other staff clear of the job site; Aware of load restrictions etc. and other specs as set out by the manufacturer; Pre-shift work area survey and machine check; Having all associated equipment safely stored on the lift platform; Isolating off the work area when major work projects are to be finished; and ensuring a smooth and safe operating speed for various plant conditions

Each and every individual will be tested to make certain they can efficiently and safely use your site-specific machinery.

Manlift Safety

Manlifts can be extremely dangerous equipment since they are capable of lifting a worker 20 feet or higher in the air and that creates a particular amount of risk. Because the danger is so apparent, lift owners and operators are careful to properly maintain their machines and follow correct operating procedures and safety precautions. The ratio of accidents involving this particular machine is quite low.

The safety specifications for scissor lifts and boom lifts puts the burden for safe manlift operation on the user. You are responsible for understanding how to safely utilize the lift even if you only lease the machinery for one day. The most basic safety features on the equipment are safety decals and the operating handbook. These show vital information regarding the safety machinery, maintenance and operating procedures.

Newer lift models would come with guidebooks and decals in place. Technically, the operating handbook should be stored on the lift itself. If you are purchasing a used lift, it is important to ensure that the guidebook is included and that essential decals haven't been painted over. The restraints that prevent operators from falling and the guardrails are other important safety features. These are mandatory and standard on all kinds of lifts.
