

Fort McMurray Manlift Certification

Fort McMurray Manlift Certification - The Elevated Platforms and Manlifts Certification course helps to provide the necessary training on the work practices, safe operating procedures, rules and regulations regarding the everyday activities for the operators of this machine. The course has been designed for people who are actively involved in these activities or those who have a basic understanding of this machinery.

In the last couple of decades, manlifts and aerial platforms have become a common sight on construction job sites and in industrial maintenance applications. These equipment provide an easy way to lift workers close to what should be performed on a stable platform apparatus, enabling employees to perform tasks with greater safety and comfort rather than being perched on top of scaffolding or ladders.

The manlift is like other industrial devices in that they are safe if used correctly. Because they lift workers above floor or ground level, accidents could occur easily and this can result in serious fatalities or injuries for both the operators of the manlift and whoever passerby who might be unlucky enough to be standing beneath.

Manlifts come in various models. Most fit into 1 or 2 categories: the scissor lift, that is capable of moving up and down and the articulating boom lift, that could move both vertically and horizontally.

Protecting Workers

Correct training is very important when it comes to safety matters. Many of the companies which rent manlifts will offer training at the jobsite. Every worker who would be working on the equipment or operating it should receive training in safe operations. It is likewise vital that only those employees who have received training should be authorized to operate the controls. Operating procedures and communication rules should be clear. Hence, employees on the ground should not operate controls without the approval and knowledge of any staff in the basket.

Those employees who will be occupying the basket are required to wear right fall protection like for example lanyard and a harness. That protection should be attached to the manlift itself and not to a surface nearby. The employee should make certain that she or he has made whichever adjustments required to reflect the change in fall distance if the height of the work area changes.

To make sure that the manlift is in good operating condition, manlifts must be inspected and tested each day. Prior to utilizing the equipment, whichever defects must be re-checked and repaired.
